# OFFER SOP

**“Make an offer so good people  
feel stupid saying no.”**

*— ALEX HORMOZI*

# THE OFFER

*How to construct an offer prospects feel stupid saying no to.*

The goal of your offer is one thing — make an offer so good that people feel stupid saying no.

## THE THROUGH-LINE

Your offer is not revealed at the end of the presentation. It is woven through every single touchpoint — from the first knock or first cold call, through the appointment-set, the pre-presentation, and reinforced when your rep sits down at the kitchen table.

***“You can go solar for less than your current bill.”***

That headline gets echoed at every stage. By the time the actual numbers come out, the prospect has already heard the core promise four or five times. That is what makes the close feel like a confirmation, not a pitch.

### Why it lands as confirmation

The prospect already has the pain. They've shown you that — they gave you the time of day, took the call, booked the appointment. People with no pain on their power bill don't agree to sit through a solar presentation. By the time you're in front of them, the pain is established.

So when you echo “you can go solar for less than your current bill” from the very first contact, you're not pitching them anything. You're confirming a solution to a pain they already feel. That's why it lands as relief, not as a sales line.

### The underlying offer in its simplest form

Strip everything else away and the offer is just this — you stop paying power bills, you're protected from the grid, you're self-sufficient, you run your home off your own energy. That is the entire offer. Every lever, every guarantee, every bit of positioning is built on top of that single promise.

And underneath that, there's one more layer the prospect needs to feel: they're not on their own. Solar isn't a one-time transaction — it's a 25-year relationship with a partner locked in for the full life of the system. That long-term partnership thread runs through every guarantee, every check-in, every optimisation. It's not a sale and a handshake — it's a partner equipped with you for the next 25 years.

Reps need to internalise this. The levers and guarantees aren't separate things — they're the structural support for one simple message: you don't have to keep paying for power. The bill stops being something the grid takes from you and becomes something you produce yourself.

Get that message echoing through every touchpoint and the close is no longer a close — it's the prospect catching up to a decision they've been heading toward the whole time.

## THE SIX LEVERS

Every offer your reps deliver is built on the same six levers. The order matters. Levers 1–3 are always pulled hard — they apply universally and lead every conversation. Levers 4, 5, and 6 are calibrated — pulled harder or softer depending on what the prospect cares about.

### LEVER 1 — Payments same or lower than current bill

The prospect is not spending more. They're redirecting money they're already losing to the grid every month — except now that money builds equity in an asset they own.

The mental model: instead of renting their power, they're owning it. Same as the difference between renting a car and owning one, or renting a house and owning one. The same monthly outlay that's currently a pure liability — money disappearing into the grid every month, never coming back — becomes an asset that builds equity in their home.

**Why this lever leads:** it kills the “I can't afford it” objection before it forms. Solar isn't a new expense — it's a smarter version of the expense they already have. Zero out of pocket. Same or lower payment. Different destination.

The “zero out of pocket” piece is doing more work than any other phrase in this lever. Most prospects walk into a solar conversation assuming they need to write a \$15k cheque on day one — that silent assumption is killing deals before reps even arrive. Government rebates, tax incentives, and finance options are why the maths works at zero out of pocket — but reps don't lead with the rebate, they lead with the outcome: same bill, different destination, no money down.

**How it gets communicated:** ongoingly. This is the bread and butter of the entire offer. “You can go solar for less than what you're already paying” hits at the door, on the phone, in the pre-presentation, and at the kitchen table. The repetition isn't accidental — it sets up the aha moment that lands at the end of the presentation, when the actual numbers on the page add up to exactly what you've been telling them the whole time. That's when the message stops being a claim and becomes a confirmed reality — and that's the moment the prospect leans in.

### LEVER 2 — Fully guaranteed, zero risk

People will always look for how this can go wrong. It's reflex — the moment any deal is on the table, the brain starts hunting for the catch. Lever 2 is what we use to completely safeguard them and their investment — closing every angle of risk before the prospect can even articulate the worry.

This is where [COMPANY]'s 6 guarantees come in. Each one targets a specific fear the prospect is silently running through:

- **[X] Day Downtime Guarantee** → “what if it breaks and sits broken while my bills start accumulating again”
- **100% Savings Guarantee** → “what if it doesn't save me what you said it would”
- **Active Monitoring Service** → “what if something goes wrong and I don't notice”
- **Hail Damage Cover** → “what if something out of my control wrecks or breaks it”
- **Parts and Labour Cover** → “what if there's an issue with the install or extra costs come up later”
- **Ongoing Savings Optimisation** → “what if there's a better deal out there I'm missing — what if I'm not making the most of my solar investment”

Stacked together, the 6 guarantees remove every angle of risk. There is no “what if” the prospect can pose that isn’t already covered. That’s the feeling you’re engineering — not just protected, but exhaustively protected.

**All six guarantees are 25-year guarantees.** That timeframe is doing as much work as the cover itself. The prospect isn’t signing up for a 12-month warranty and a service rep who disappears the moment the panels are bolted down — they’re signing up for a partner locked in for the full life of the system. Active monitoring, ongoing savings optimisation, parts and labour, hail damage, downtime, savings — all of it covered for 25 years.

The longevity of the cover *is* the proof of the relationship. It signals that [COMPANY] isn’t disappearing after install — it’s built into the structure of every guarantee. That ongoing-relationship layer is what turns a one-time install into a lifetime account, and it’s what makes the prospect feel exhaustively protected rather than just protected.

### LEVER 3 — Locked-in payments, no increases

Their power bill goes up every year. Forever. That’s not speculation — that’s the entire history of the grid.

Their solar payment doesn’t move. Locked in for the 10–15 years of the loan — and they can pay it off at any point with no additional costs if they ever want to clear it early. Once the loan is paid off, the payment goes to zero — but the system keeps producing power for another decade-plus.

**Why this lever matters:** from year one, the prospect is saving money — not paying a cent out of pocket, actually keeping more in their pocket every month than they were before. Then look 10, 15, 20, 25 years out: the difference between money sitting in their pocket and money getting ripped from them by power companies year after year is monumental. That gap is what turns the offer from “yeah, this seems good” into an absolute no-brainer.

**How it gets communicated:** contrast. Always against what the grid does year over year. The prospect needs to feel the trajectory, not just hear the number. “Your bill keeps climbing. Your solar payment doesn’t move — and then it ends completely.”

### LEVER 4 — Energy independence

The grid is not stable and it is not on their side. Prices keep going up, blackouts are getting more common, and every household connected to the grid is at the mercy of decisions they have no say in.

Solar takes them off that ride. They’re producing their own power. With a battery, they’re protected during blackouts — lights stay on, fridge keeps running, kids aren’t sitting in the dark while the rest of the street is. They stop being a customer of the grid and start being self-sufficient.

**This lever is its own animal.** Lever 3 is about dollars — locked payment vs. rising bill. Lever 4 is about something deeper: not being at someone else’s mercy. Different fear, different value, different emotional weight. Some prospects respond more to the dollars, some respond more to the independence.

**Lean into this lever harder when:** the prospect mentions recent blackouts, talks about the grid going up, lives rurally or in storm-prone areas, has young kids or elderly parents in the home, or expresses any general distrust in power companies. For older prospects who lived through the 2022 and 2024 price spikes, this lever can hit harder than the maths.

### LEVER 5 — Adds property value

Solar isn’t an expense. It’s an asset that lifts the value of the home it’s installed on.

**Why this lever exists:** it kills the “what if I sell” objection and reframes the whole conversation. Every other monthly bill the prospect has — power, internet, insurance — disappears the moment they walk away from the property. Solar doesn’t. It stays with the home and increases what the next buyer will pay.

**How this lever lands hardest — show, don’t tell.** Reps don’t just claim the property value goes up. They show it. Pull up a credible third-party source — a national property report, real-estate body data, an independent valuation study — and put the actual numbers in front of the prospect. Typical uplift on solar + battery, across the country, with the source visible. The data does the convincing, not the rep. That’s what makes the lever undeniable.

Once the data’s in front of them, the frame writes itself: even if their plans change tomorrow and they sell next year, they profit. The system pays them either way — either through 25 years of energy savings or through the value uplift on sale. There is no scenario where this goes wrong. That’s the moment Lever 5 stops being a “nice to have” and becomes the lever that hands them the key.

**Always touch this lever.** Lean into it harder when the prospect is older, talking about retirement, mentions selling, or is treating solar as a “should I bother at this stage of life” decision. For older prospects in particular, the property-value frame can be the deciding factor.

## LEVER 6 — Better for the environment

Cleaner energy. Less reliance on coal and gas. A measurable reduction in their household’s carbon footprint.

**Why this lever lives at the bottom:** most prospects don’t buy solar for environmental reasons. They buy for the maths. But for the prospects who do care, this lever is what makes the decision feel right beyond the numbers — and you don’t want to leave that on the table.

**Lean into this lever harder when:** the prospect mentions sustainability, has kids, talks about the future, or asks about feeding power back to the grid. Otherwise, mention it briefly and move on.

## THE COST OF WAITING

The six levers establish what the prospect gets by saying yes. The cost of waiting establishes what they lose by saying no — or by the much more common version of saying no, which is “I’ll think about it.”

Every month they delay is money permanently gone. The grid takes it, it’s never coming back, and there is no future scenario where waiting six months recovers what those six months would have saved them. Solar isn’t a decision they’re putting off — it’s a decision they’re paying for every month they don’t make it.

**Why this section sits between the levers and the close:** without it, the offer feels great but not urgent. The prospect leaves the kitchen table thinking “yeah, I’ll get around to it” — and “I’ll get around to it” is the most expensive sentence in solar. It costs them tens of thousands of dollars over the life of the system, every dollar of which goes to the grid instead of to their own pocket.

This is not manufactured urgency. It’s just maths. And reps need to be able to communicate it cleanly — not as pressure, but as the natural consequence of how the levers stack up. If the levers are true, then waiting is genuinely costing them. The cost of waiting is just the levers run in reverse.

## POSITIONING — THE SPECIALIST FRAME

The system designed for the prospect has to feel built specifically for them — not picked off a shelf, not copy-pasted from the last job.

This is the most important section in this SOP. Without correct positioning, every lever above weakens — because a generic solution doesn't earn the guarantees, doesn't justify the price, and doesn't generate the felt sense of "this was built for me."

### How specialist positioning gets demonstrated

The prospect sits down with an actual specialist, not a generic salesperson. The technicians designing the system aren't picking a package — they're calculating an outcome based on this specific household's energy profile.

That means plugging in every individual metric that affects performance:

- Roof type and material
- Shadiness percentage across the roof surface
- Panel orientation (north / east / west) per array
- Panel angle and tilt against the roof pitch
- Total bill amount (kWh and dollar value)
- Daytime vs night-time usage split

Each one of those inputs goes into the calculation. Every metric is plugged in for a specific reason — to make sure the system that gets designed is the system that exactly covers their usage. Not under-spec'd. Not over-spec'd. Calculated.

This gets demonstrated again at the savings calculation stage of the presentation — the prospect needs to see the inputs, see the calculation, see the outcome. That visibility is what cements the specialist frame in their mind.

### Why tailoring matters more than the components

The components matter — panels, inverter, battery, monitoring. But the components are not what closes the deal. Tailoring is.

**A general solution — no one cares. A solution built specifically for them — they care.**

Same panels, same inverter, same install crew. The difference between a deal that closes and one that doesn't is whether the prospect feels the system was designed around them or whether they feel like they're being sold a stock package.

That's why every metric matters. Not because the prospect understands the technical detail of panel orientation — most won't — but because watching someone plug in the specifics of their roof, their bill, their usage tells them something a brochure never can: this was built for me.

## WHY THIS WORKS — THE NO-BRAINER

By the end of a properly delivered presentation, the prospect should not be thinking. They should be feeling.

***"This is a no-brainer. There's no way this goes wrong for me."***

That sentence should land in their head as a feeling, not a conclusion. You're not trying to make them reason their way to yes — you're trying to tick every box so completely that the yes is just there, sitting in their chest, before they've consciously decided anything.

### What every-box-ticked feels like

When the offer's been delivered properly, the prospect's internal state should look something like this:

- My payment's the same or lower than what I'm already paying.
- It's locked in while my neighbour's bill keeps climbing — and then it ends.
- I'm fully covered. Six guarantees. Zero risk.
- I'm not at the mercy of the grid anymore.
- My property's worth more.
- I'm doing the right thing for my kids and the environment.
- And the system was built specifically for my house, my roof, my bill.
- Every month I wait is money I'm never getting back.

Every box ticked. No "what if" left standing. The prospect doesn't consciously walk through this list — they just feel the absence of any reason to say no. That's the no-brainer state.

### **Pull, not push**

A pressured prospect buys today and refunds next week. A prospect who feels stupid saying no buys today and tells their neighbour next week.

Pressure is a short game. Pull is the long game. The offer itself does the work — every lever, every guarantee, every piece of tailored positioning is engineered so that by the end of the presentation, the prospect is leaning in, not being leaned on. The rep just delivers it cleanly.

## **THE OFFER IS THE SPINE**

Every script your reps run, every prop they use, every objection they handle — all of it serves one purpose: delivering this offer cleanly so the prospect feels stupid saying no.

Get the offer right and the rest of the sales process becomes execution. Get the offer wrong and no amount of pitching skill can save it.
