

PILLAR 2

SOLAR EXPLANATION

“If you can’t explain it simply,
you don’t understand it well enough.”

— ALBERT EINSTEIN

Without authority, every other pillar is dead weight.

SOLAR EXPLANATION

Pillar 2 of 12 • Presentation

THE GOAL

Establish yourself as the expert. By the end of this pillar, they should be thinking:

“This individual clearly knows their stuff — I trust what they’re telling me.”

Most customers don’t actually understand solar. Educating them clearly and confidently is what builds the authority that carries the rest of the presentation.

WHY IT MATTERS

- **Authority compounds.** The expertise you build here makes every later pillar land harder. They believe you because they trust you.
- **Pre-handles “I can’t afford it.”** The Green Loan slide kills the #1 financial objection before it forms.
- **Pre-handles “What if I sell my home?”** One of the most common objections at the close — handled here so it never comes up.
- **Sows the seeds for Pillar 11 (Finance Walkthrough).** When they see the actual numbers later, they’ll think “oh wow, what they said was actually genuine — this is legit.” You can say anything, but until they see the numbers it doesn’t hit as hard. This pillar plants the seed so the proof later confirms it.

TONALITY

Confident, certain, explain everything simply. Not lecturing. Like explaining something interesting to a mate, not delivering a pitch. You know this stuff inside out — that confidence comes through naturally.

“I am not here to confuse you, I’m here to keep it simple and help you understand it.”

Internalise this — it’s the mindset that makes everything else land.

FLEX YOUR EXPERIENCE (WHEN IT LANDS NATURALLY)

If you’ve got industry experience, drop it — it directly reinforces the expert positioning this pillar is built around. Don’t force it — natural is everything.

Natural moments it lands well

- **During the gauge-knowledge question** — “I’ve been in this industry for a decade now, and honestly it still shocks me how...” (then drop a relevant observation — e.g. few people know how it works, how much the industry has changed, etc.)
- **During the feed-in tariff history** — “I’ve watched this whole shift happen over the years...”
- **During the property value section** — “I’ve helped plenty of families through this...”

One mention is enough. Overdoing it has the opposite effect — kills authority instead of building it.

SLIDE 1: HOW SOLAR WORKS (HOUSEHOLD BREAKDOWN)

Walk through items 1–6 of the diagram. Conversational, not robotic. Sample talk tracks below — don’t memorise word-for-word.

Before walking the slide: gauge their knowledge

Ask first — gauges where they’re at and gets them engaged. Whatever they say, you walk through it anyway. No one ever says “skip it.”

“Guys, do you actually know how solar works now that batteries have come into play?”

1. Solar panels → electricity

“First thing — sun comes up in the morning, panels on your roof capture sunlight and turn it into electricity.”

Flexibility moment — drop a light joke here if it lands. Example: “We’ve got the old sun up there, hopefully sticking around for the next few hundred years — unless Elon Musk decides we’re all gonna live in space.” Don’t force it. Point is to keep it casual, not robotic.

2. Inverter — the brains of the system

“That electricity goes into your inverter — the inverter’s basically the brains of the equation. It powers your home during the day, so you’re not paying for the aircon, the fridge, all that, while the sun’s up.”

3. Priority #1 — powering your home

“First priority of the system is always powering your home. Sun comes up early — so straight away as you’re waking up or already up, anything you’re using is being powered by your panels. Aircon, fridge, lights, whatever.”

4. Priority #2 — charging battery / EV

“Anything left over after that — second priority — charges your battery, or your EV if you’ve got one. So if you’re not using much power during the day, that surplus is filling up your battery for the night. If you ARE using a fair bit, perfect — covers your bill first, then anything extra still charges the battery.”

5. Blackout protection

Ask them about their experience first — funnels naturally into the explanation.

“By the way, guys — have you ever had a blackout at the property? Do you get them commonly?”

Listen to the answer, then funnel into:

“Well, if you’ve got a battery installed, you’ve also got blackout protection — so when the grid goes down, your home stays powered and you’re protected.”

6. Grid stays connected (+ feed-in tariff)

“Anything still left over after all that gets sent back to the grid. And the grid stays connected for any extra you need at night or on cloudy days.”

Pre-handle the “feed-in is bad now” thought before they have it:

“They don’t give you much for what you send back these days — but don’t worry, we’ve got our team on it. We make sure you’re always with the power company who pays you the most, so you always profit the most off what you send back. There’s also a feed-in tariff guarantee we’ll touch on later, but don’t worry about that for now.”

Bridge into the feed-in tariff history

Keep it conversational. You don’t need to script this perfectly:

“By the way — way back, the way everyone used to do it, you could sell your excess straight back to the grid and they’d pay you for it. Pretty well too. You probably had a mate or two who got rich off solar telling everyone how good it was.”

“Power companies got greedy though — as usual — took it all back, started undercutting everyone. Now you get pretty much nothing for it.”

“So our way to fight back is batteries. You use your own power, self-sufficient, stop paying them altogether.”

This moment is part of what makes them perceive you as the expert. Most customers have no idea this is the history.

Check in before moving on

“Does that sound easy enough?”

Quick gut-check after the walkthrough.

Get a soft yes on daytime usage

“By the way guys — solar is really easy. You don’t have to do anything, it works all on its own — even the battery switches over on its own. Really the only one thing you need to do is use more power during the day. That’s not impossible for you guys, is it?”

Gets them committing to a small ask (using more power during the day) — soft yes that builds momentum.

Address each partner specifically

“[Partner 1] — that makes sense?”

“[Partner 2] — any questions at all?”

Crucial — addressing each partner separately ensures both are on board. If only one engages, you’ll lose the other later in the call.

SLIDE 2: THE REBATE (OPTIONAL)

Optional but strongly recommended. Explains WHY \$0 out of pocket is actually possible — and the urgency that makes them act now instead of later.

Note: The specific rebate, dollar figures, and history vary by location. The example below is the AU battery rebate — adapt to your region. What stays the same: always ask first, focus on what it means for them (not the math), and let the urgency speak for itself — you’re stating facts, not pushing pressure.

Step 1: Always ask first

“By the way — are you guys clued into the [rebate / incentive] at all?”

Always ask. Most won’t know much, which gives you the opening to explain. Listen properly to whatever they do know.

Step 2: Explain what it actually means

Don’t drill into math or technical detail. Hit the points that actually matter to them:

“One thing most people don’t actually know about this rebate is that it’s a one-and-done. Meaning once it’s done, it’s literally done.”

“The last rebate like this came out about 10 years ago.”

“And you know how the government is — they’re always crapping on us. You might as well get something back for all the tax you’ve been paying. You can get up to [\$X amount] off your system through this.”

Step 3: Raise ownership (state facts, don’t push)

The urgency is real — but you don’t push it. You raise ownership by stating what’s true and letting them decide if they want to make the most of it. Customers respect facts much more than pressure.

“There’s around [X] battery rebates available across the country, and we’re already doing [X] new installs every year.”

“So if you actually want to make the most of this rebate — realistically, we can’t put any guarantees about how long it’ll be here. We’ve had customers come back three months from now expecting the same rebate, same pricing — and we just can’t guarantee that’s going to be the case.”

“It’s just a situation of acting now or missing out — once it’s gone, it’s one and done. That’s outside our control, which I’m sure you can understand.”

Lay it out plainly. The math speaks for itself. No matter what the rebate looks like in your region, the principle holds — facts and ownership > pressure.

Why this slide sets up Slide 3

Once they understand the rebate is what makes “\$0 out of pocket” possible, the Green Loan slide stops feeling like a sales gimmick and starts feeling like a legitimate, time-limited opportunity. The urgency from this slide carries straight through to the close.

SLIDE 3: THE REAL COST OF SOLAR — GREEN LOAN

Pre-frame before the chart

Set this up before walking the numbers. Most customers are sitting on a misconception that kills the deal before you’ve even shown them the chart — kill that misconception first.

“Unfortunately, a lot of the time, what holds people back from even looking at solar at all is that they think you have to put down like a \$40K investment or something absolutely crazy to get a solar system.”

“But that’s actually not the case at all. Truth is — 99% of people are already paying for solar. We just use the money you’re currently spending on your bills to pay for the system. That’s all that’s happening here. You literally don’t have to pay one cent out of pocket — you’re just redirecting what you’re already spending.”

Walk through the chart visually

Point at the visual elements as you talk through them. Walking the chart visually makes the concept land much harder than reading bullet points. (Note: chart colours may vary — adjust the colour names you say to match what’s actually on the slide.)

“This yellow area here is your total savings with solar over 25 years.”

“This green area here is your repayments on the system.”

“As you can see — the yellow covers the green completely. You’re literally using the savings to pay off the system. That’s it.”

Key principles to reinforce

- **\$0 upfront.** “You don’t pay a cent to get it on your roof.”
- **Savings cover the repayments.** “You’re paying less than what you’d be paying the power company anyway.”
- **Loan term:** 5–15 years depending on what works for them.
- **Even during the loan, they’re already saving** — repayments are less than what their bill would’ve been. Most reps undersell this.
- **After the loan:** pure savings for another 10–15 years, depending on the loan term they chose.

Renting vs owning reframe

“Instead of renting your power from the power company forever, now you’re actually owning it.”

The dead money reframe

“Think about it this way — you’re switching dead money you’re donating to the power companies → straight into solar that actually saves you money, adds value to your home, and protects you during blackouts.”

The either/or money frame

Tailor the numbers to their actual bill — these are placeholders, not fixed amounts. Pull from the bill they showed you.

“And the truth is, whether you decide to go solar or not — you’re paying for a solar system regardless. Roughly \$[X] a year on power, over 10 years that’s \$[X].”

“You’re either giving that \$[X] to the power company with no return — or you’re putting it towards a system you actually own. So 5–10 years from now, you can be looking back at a fully paid off solar system, instead of still paying the power company forever.”

Check-in

“Does that concept seem sensible?”

Wait for the soft yes. If they have questions or pushback, address them before moving on.

Let them read the bottom-of-slide question silently. “If it cost \$0 upfront and the savings covered the repayments... would you really keep paying your power bill instead?” — don’t say it out loud, let it land.

The “what if I sell my home?” pre-handle

One of the most common objections at the close. Plant the answer here, before they think to ask it. Order matters — pre-frame the no-exit-fees fact before walking through the sale scenario.

Step 1: Pre-frame the no exit fees (critical)

“Just so you know, the Green Loan has no early exit fees and no extra cost if you pay it out early. No one’s trying to make a quick buck off you — it’s literally been put in place to help people save money.”

Step 2: Walk through the sale scenario

“People always ask me — ‘what happens if I sell my home?’ It’s actually really interesting. Once you add solar and battery, it adds quite a bit to your property value — there’s data on this.”

Show your credible property value resource here.

Example research: a national property report — e.g. the Domain National Property Report for Australia (2025) — which showed properties with solar and battery were 14% more valuable. It wouldn’t be difficult to find a credible local equivalent for your area, no matter where you’re located.

“So let’s say you decide to move a couple of years from now. You sell the home with all the extra value the solar and battery added. You pay off the Green Loan with that extra value — and you pocket a huge profit on top. Pretty simple.”

Bridge to Pillar 3 (Solar Industry Issues)

Once they're sold on the concept, the natural next question is which company they go with. This bridge plants the seed for the industry pillar coming next.

"Once it makes sense, honestly the real question becomes who you actually go with. A lot of these companies — their systems and products won't even last 5 years, and it actually becomes a negative investment. Which is exactly what we'll get into next."

FAILURE MODES (DO NOT DO)

- **Lecturing instead of conversing.** If it sounds like a textbook, you've lost them. Keep it casual.
- **Going too deep on technical detail.** They don't need to understand MPPT trackers or string voltage. Keep it household-level.
- **Skipping the gauge-knowledge question before walking Slide 1.** Going straight into explanation feels rehearsed and salesy.
- **Skipping the check-in at the end of Slide 1.** They need that breath of agreement before you pile on more content. Without it, the rebate slide and Green Loan slide land on a wall, not an open door.
- **Skipping the "are you clued into the rebate" question.** Straight into explanation feels like a pitch — asking first builds the opening.
- **Pushing urgency instead of raising ownership on the rebate slide.** "Now-or-never" pressure is exactly what kills it — facts and ownership land. Pressure repels.
- **Skipping the rebate slide entirely.** It's optional but it's what makes Slide 3 (Green Loan) actually land — without it, \$0 out of pocket feels like a sales gimmick.
- **Skipping the "what if I sell" pre-handle.** The objection forms later and is much harder to handle at the close.
- **Underselling the no-exit-fees fact.** It's a massive pressure-reliever. Say it with conviction.
- **Not having a credible property value resource ready.** If they ask for proof and you don't have it, the whole pre-handle collapses.
- **Reading the bottom-of-slide question out loud.** It's planted for them to read silently — saying it aloud kills the effect.

Remember: the job of this pillar is authority. If they finish this section thinking "this guy knows his stuff," you've won. The rest of the presentation gets easier from here.
