

PILLAR 9

SOLAR SAVINGS BREAKDOWN

“The goal isn’t to convince them to buy.
It’s to remove every reason not to.”

— ALEX HORMOZI

Hold the battery back. The contrast does the selling.

SOLAR SAVINGS BREAKDOWN

Pillar 9 of 12 • Presentation

THE GOAL

By the end of this pillar, the customer should think: “okay — the system covers my usage every month, the math has been done specifically for my home, and even on solar alone it’s decent. Now I want to see what happens with the battery.” This pillar is intentionally designed to land solar-only as modest — not because the system is weak, but because we’re holding the battery reveal back for Pillar 10 (Case Study Close) where it cashes in as the moment that flips the whole deal cash-flow positive.

“The math has been done specifically for my home. Even on solar alone it’s decent. Now I want to see what happens with the battery.”

WHY IT MATTERS

- **Cashes in the production chart promise from Pillar 6.** Slide 1 of Pillar 6 showed the seasonal production chart with the average usage line above production — framed as “we’ll show you why this matters when we look at the design.” This pillar is where the same chart returns, but now the usage line is below production every month. Visual proof the system is dialed in.
- **Demonstrates the meticulousness behind the Savings Guarantee.** Plugging every metric in front of the customer shows they aren’t getting a generic quote — they’re getting a system calibrated to their exact roof, exact orientation, exact angle. That specificity is what makes the 100% Savings Guarantee from Pillar 7 feel earned.
- **Sets up the battery reveal as the moment.** By holding the battery back and showing solar-only first, the case study close in Pillar 10 gets a much bigger emotional payoff. Customers go from “okay, decent numbers” to “wait, this is cash-flow positive from day one?” in the space of one transition. Structural contrast does the work.

TONALITY (CRITICAL)

CONFIDENT, METICULOUS, LET THE NUMBERS DO THE WORK

This is a numbers-driven pillar. Your job isn’t to sell — it’s to walk the customer through the math, calmly and accurately. The credibility you’ve built across Pillars 1–8 carries the energy here. Hype mode actively hurts — the calmer and more matter-of-fact you are, the more legitimate the numbers feel.

- **Meticulous, not rushed.** Plugging in every detail is the point. Even if you could do it faster, slow it down — the specificity IS the proof.
- **Let the visuals talk.** The production chart, the pricing breakdown, the savings table — all of these speak for themselves. Don't over-narrate. Just point at what they're already seeing.
- **Present pricing flatly.** When you show the system cost, don't pitch it. State the number, walk the breakdown, move on. The customer will engage with price — but they engage less if you signal concern about it.
- **Frame solar-only as a setup, not a destination.** The whole pillar is a build to Pillar 10. Don't oversell solar-only savings — let them sit at "decent." The contrast with the battery reveal is what does the work.

Scripting note

This pillar has 5 sections: (1) plug in the system specifically and meticulously, (2) production chart reiteration, (3) walk the pricing, (4) walk solar-only savings (the bulk of the pillar — pre-frame, year 1 break-down, ROI framing, hedge-against-inflation, cumulative savings), (5) the cash vs. payment plan question with both paths fully scripted. The hard rule before transitioning to Pillar 10: customer must be fully sold on brand/warranties, savings/numbers, system design, and pricing.

TRANSITION FROM PILLAR 8

Pillar 8 closed with the rep delivering: "Yeah, no doubt — and the good thing is, there's no reason you would have to anymore. Let me show you now." That "let me show you" is the natural opener for Pillar 9 — no additional verbal switch needed.

Move straight into Slide 1 (Plug In the System) on the same breath as the Pillar 8 close. The energy from the pain pivot carries directly into the meticulousness build.

SLIDE 1: PLUG IN THE SYSTEM (THE SPECIFICITY BUILD)

This is the calculator's system entry tab. Every spec gets entered in front of the customer — orientation, tilt, panel count, system size, inverter, etc. The point isn't for the customer to follow the math — it's for them to FEEL how meticulous and specific the process is. This is the structural proof that the Savings Guarantee from Pillar 7 isn't a marketing claim — it's built on real, specific data.

Beat 1: The specificity frame (fully scripted)

Open with the frame — tell them WHY you're about to plug everything in so carefully. Connects back to the Savings Guarantee.

"Alright guys — first thing we have to do is plug your exact system into the calculator. We're going to put in your exact orientations, the exact tilt of the panels, the exact angle, your bill data, all of it. It's really important we get this accurate, because remember — we've got the 100% Savings Guarantee on whatever numbers come out of this. So the math has to be specific to your home."

Tonality: calm + meticulous. Said like a procedural step that matters — not like a sales setup. The Savings Guarantee tieback is the credibility anchor.

Beat 2: The solar-only pre-frame (fully scripted)

Set the frame from the start. The customer needs to know now — before any numbers come out — that we're going to walk solar-only first, then battery. This prevents them from reacting to the modest solar-only savings as if those are the final answer. The structural promise of "something with the battery" primes Pillar 10 without giving anything away.

"By the way guys — quick heads up before we start plugging in. We're going to look at everything for solar only first, and then we're going to look at it with the battery side of things shortly. Just that I might be able to do something for you guys regarding that."

Tonality: casual confidence. Said like a procedural heads-up — not a tease. The customer should hear: "these guys are doing this in steps for a reason." Don't over-explain why — just plant it and move on.

Why this phrasing works: the "I might be able to do something for you guys regarding the battery" line is the structural setup for the Pillar 10 Case Study Close. The case study offer is built around the BATTERY specifically (we discount the battery side of things in exchange for marketing photos). Setting up the "something I might be able to do with the battery" frame here makes the Pillar 10 reveal land as a fulfilled promise, not as a surprise sales move. Don't skip this connection — it's the spine of the back-half of the presentation.

Beat 3: Walk through the system specs (dot points)

Plug each spec in one at a time, narrating as you go. Don't rush this — the deliberateness IS the proof.

- "Location going in — that sets your local sun hours"
- "Total panels — [X], at [X] watts each"
- "System size — [X] kW total"
- "Roof orientations — [X] panels north, [X] east, [X] west, etc."
- "Tilt for each — [X] degrees, that's your roof pitch"
- "Shading derate — [X]%, based on what we discussed earlier"

Tonality: matter-of-fact + slight nod after each entry — like you're ticking off a checklist. The customer should hear: "these guys are doing this properly."

Localisation note: the exact fields in your calculator may differ. The principle is the same regardless — plug each spec in visibly and narrate it. Don't silently set up the calculator off-camera and then reveal results — that loses the entire point of this beat.

Beat 4: Daily usage entry

Check their retention before plugging in the daily usage figure. The interactive moment is small but it matters — if they remember the number themselves, the rest of the calc lands as their data, not yours. If they don't remember, just remind them and move on.

"Do you guys remember how much we said your average daily usage was, based on what we worked out from your bill?"

Tonality: casual + curious. Genuine check, not a quiz. If they remember — "yeah, perfect, [X] kWh per day." If they don't — "all good, it was [X] kWh per day, that's what we're plugging in." Either way

you plug it in cleanly and move on.

- “Daily usage — [X] kWh per day, plugging it in now”

This figure should already be locked in from Pillar 6 / Pillar 8 bill walk-through. The check-in here just makes the plug-in feel collaborative rather than rep-driven.

Beat 5: The day/night usage question (critical)

This is one of the most important beats in the pillar. Asked right before plugging in self-use. The way you frame the question and weight the answer directly determines battery sizing and savings projections later.

“Okay guys, quick one for you here — out of your total daily usage, roughly what percentage do you use during the day versus at night?”

Tonality: casual + curious. Asked like a natural calibration question, not a sales setup.

WEIGHTING STRATEGY — HARD 50/50 CAP ON DAY USAGE

- **Never go above 50/50 day/night.** Even if the customer claims 60% or 70% daytime usage, weight it down to 50/50 maximum. Going higher inflates self-use and makes solar-only look unrealistically good — which violates the Savings Guarantee and feels dishonest.
- **Define “day” narrowly:** only count 9am to ~3pm as solar-producing daytime. Anything outside that window doesn’t count.
- **If the customer claims 60–70% day:** anchor down. “Yeah look, in reality once you take morning and evening usage out, it’s usually closer to 50/50 at most — remember solar really only produces meaningfully between 9 and 3.”
- **If they say “maybe 50/50”:** take it.
- **If they say something low already (e.g., 30/70 or 20/80):** take it. Don’t correct downward, but don’t push them up either.

Why the 50/50 cap matters: anything above 50/50 daytime usage makes solar-only savings look too good, which (a) violates the Savings Guarantee promise of conservative numbers and (b) reduces the impact of the Pillar 10 battery reveal. Keeping the cap at 50/50 protects honesty AND structural setup.

This is NOT dishonesty — it’s accurate framing. Most customers genuinely overestimate their daytime usage because they forget that solar only produces meaningfully between 9–3, not from sunrise to sunset. Defining “day” narrowly is the truth.

Beat 6: Plug in self-use (day % only)

Calculate self-use without battery and plug it into the calculator.

- Self-use = daily usage × day usage %
- Example: 28 kWh daily × 40% day = 11.2 kWh, rounds to 11
- Plug that number into the self-use field
- Don’t labour the math — the customer doesn’t need to follow the calculation, just see you doing it

Tonality: matter-of-fact. The calculation should feel like a quick procedural step. Note: this is the SOLAR-ONLY self-use figure — battery is not factored in yet. We’ll update this in Pillar 10 when the

battery is added.

Beat 7: Confirm everything is in

Once everything is plugged in, do a quick verbal confirmation.

“Alright — that’s everything plugged in perfectly. Now let’s have a look at what your system actually does.”

Tonality: confident + casual. Quick handshake before moving on — not a celebration, just a clean handoff. Move straight to Slide 2.

SLIDE 2: PRODUCTION CHART REITERATION

The customer already saw the seasonal production chart back in Pillar 6 (System Design) where the heavy lift was done — we walked them through how production would cover their usage every month, and they confirmed they understood the design. This slide is just the brief reiteration: showing the chart again now with their finalised system, confirming the coverage one more time, then moving on. Don’t over-deliver this slide — the work was already done.

Beat 1: Quick reiteration

Open the chart, reference back to Pillar 6, reaffirm the coverage point.

“Alright — like I said earlier when we were going through the design, this is your chart showing exactly how much your system generates each month. And as we already established, the system covers your usage every single month of the year — which was the goal.”

Tonality: confident + matter-of-fact. Said as a brief reaffirm — the customer already bought into this in Pillar 6. Treating it as a fresh reveal here would be redundant and slow the momentum.

If the customer registers it visually with a nod, move straight on. If they want to look at the chart longer, give them 5–10 seconds, then transition. Don’t labour the chart twice.

SLIDE 3: SYSTEM PRICING WALK-THROUGH

Move to the pricing tab and walk the system cost. Three numbers: total system value (RRP), government rebates / STCs, final balance. The goal is to PRESENT pricing CONFIDENTLY — said with back in it, like “that’s what it is.” Not flatly, not apologetically. Confidence here transfers directly to the customer’s perception of the price.

Beat 1: Open the pricing tab

Pivot from production to pricing with confidence.

“Alright — let’s have a look at the numbers. First, the cost of the system itself.”

Tonality: confident + certain. Said with back in it — like “here’s what the deal is.” Don’t soften this with framing, don’t apologise, don’t hype it. Just open the page like the price is what it is.

Beat 2: Walk the pricing breakdown (dot points)

— Show the total system value (RRP) first — the “true” cost of the system if there were no government incentives

- Walk through the rebates / STCs that bring it down — note these are reducing every year and will eventually disappear
- Land on the final balance — this is what they actually pay
- State each number confidently. Don't apologise for the price. Don't hype the discount. Don't add hedging language

Tonality: confident certainty throughout. The pricing breakdown is doing the work — you're narrating with conviction, not selling. Customers respect a rep who states the price like it's the price — far more than one who softens or hedges.

Beat 3: Brief STC disappearance note

Quick mention that the rebates won't be around forever — keep it light, no urgency push.

- “Worth noting these government rebates are reducing every year and will be completely gone by [year]”

Tonality: matter-of-fact. Light touch — just plant the seed and move on. Don't push urgency, don't labour the point. The customer can verify it independently and that's what makes it land.

Beat 4: Don't engage on price yet

Don't pause to ask “how does that look?” Move straight to savings. The customer hasn't seen the savings number yet — if you engage on price now, you're asking them to evaluate cost without context.

“Now let's look at what this system will actually do for you in terms of savings.”

Tonality: calm + casual confidence. Said as a natural next step — not as a deflection from price. Move to Slide 4 immediately.

SLIDE 4: SOLAR-ONLY SAVINGS WALK-THROUGH

This is the structural setup for Pillar 10. The pre-frame from Slide 1 already established that this is solar-only. Walk the savings carefully — this is the most important comprehension moment of the entire pillar. Every number must be understood by both partners before you can move on.

Beat 1: The pre-frame (fully scripted)

Open the savings walk by flagging this as the most important part. The pre-frame both sets the weight and gives the customer permission to stop you with questions. Without this, comprehension drops and the deal weakens at the close.

“Now, this is the estimated breakdown of the savings from the system we've designed for you. I'm going to go through this carefully so you both fully understand it. I want to keep it as simple and clear as possible — and if anything comes up that doesn't make sense, please stop me and ask. This is the most important part for you to understand.”

Tonality: calm + genuine. Said with weight — you're flagging that what comes next matters. The “stop me and ask” line is the comprehension safety net. Customers who feel permitted to interrupt will actually understand the numbers; customers who don't will nod through it and stall at the close.

Beat 2: Year 1 savings broken down (fully scripted)

Walk the year 1 annual figure, then immediately break it into monthly and weekly amounts. The annual number is abstract; the weekly number is something they feel. Tie it back to the design as proof the system was built for their bill.

“Let’s start with the raw annual savings of this system — what this is going to take off your bill in year 1. As you can see, the annual savings in the year 1 column show \$[X], which is \$[X] per month and \$[X] per week. Meaning we’ve designed this system perfectly to cover your annual power cost. Does that make sense?”

Tonality: calm + matter-of-fact. The breakdown into month/week is what makes the annual number concrete — don’t skip it. Wait for the “yeah” before moving on.

Beat 3: Why savings increase over time (hedge against inflation)

Walk the year-over-year growth in the savings column. The framing isn’t “savings go up” — it’s “solar effectively costs \$0, so every electricity price rise works in YOUR favour.” That’s the hedge-against-inflation positioning that makes solar feel like a financial defence, not just a utility upgrade.

“The year below, you’ll notice the savings increase. The reason your savings increase over time is that as electricity prices rise, your savings increase as well. Solar effectively costs \$0 compared to your electricity rate — so every price rise works in your favour. It acts as a built-in protection mechanism. Solar protects you more over time, almost like a hedge against inflation. Does that make sense?”

Tonality: confident + matter-of-fact. The “hedge against inflation” framing is doing the heavy lift — deliver it with weight, not as a throwaway. Wait for the “yeah” before walking the cumulative figures.

Beat 4: Walk the cumulative savings

Walk the 10-year, 15-year, and 25-year cumulative figures. Let the numbers compound.

“So in 10 years time, you would have saved a cumulative \$[X]. In 15 years — \$[X]. And over 25 years — a massive \$[X].”

Tonality: certainty + slight headshake on the 25-year number. Slow down on the 25-year figure — let it land. Don’t rush through these.

Beat 5: The ROI framing (fully scripted)

Walk the year 1 ROI figure, then deliver the certainty framing. This is one of the strongest positioning beats in the pillar — it reframes solar from “optional purchase” to “investment with certainty most things don’t have.”

“In year 1, this is an [X]% ROI — return on investment — which only gets better every year. Honestly, there’s no investment you can make with this much certainty, because you’re going to spend this money one way or another. Every year with solar = more savings.”

Tonality: confident + certainty. The “you’re going to spend this money one way or another” line is the lock-in — it converts an “ROI conversation” into a “you’re paying either way” conversation. Said matter-of-fact, not as a sales line.

Beat 6: Hard rule — confirm both partners understand

DO NOT MOVE ON UNTIL BOTH PARTNERS CLEARLY UNDERSTAND THE RAW SAVINGS AND HOW THEY GROW OVER TIME.

If either partner is unclear, the deal weakens at the close. Address each partner specifically before moving to the cash vs. green loan question.

“[Partner 1] — does that all make sense to you?”

“[Partner 2] — any questions on those numbers at all?”

Tonality: genuine + casual. Wait for explicit confirmation from BOTH. If only one engages and the other is silent, you'll lose the silent partner at the close. This is a structural check-in, not a closing technique.

SLIDE 5: CASH VS. GREEN LOAN (THE KEY QUESTION)

Once both partners understand the raw savings, ask the cash vs. green loan question. Their answer bifurcates the rest of the pillar — cash path is short and sharp (no interest, fastest ROI), green loan path is the longer walkthrough (sell the finance company, recycling money frame, payment options, year [X] cash-flow positive). Don't skip this question — it's the unlock for the rest of the pillar.

Beat 1: Ask the question (fully scripted)

Frame it as a hypothetical (“just suppose”) so the customer doesn't feel committed to anything. The answer tells you which path to walk.

“Just suppose you guys were to go solar — would you be leaning more towards paying for it outright, or using the green loan?”

Tonality: genuine + curious. Asked like a real question, not a setup. Wait for their answer before walking either path.

Path A: If they say cash

Short and sharp. Cash is the best option financially — no interest, fastest ROI. Walk the ROI column on the calculator and move on.

“Honestly, that's the best option you can choose. The reason is you're not paying any additional interest charges to a third-party company. It's the fastest way to receive your return on investment.”

Tonality: confident + matter-of-fact. Don't oversell cash — just affirm it's the strongest option and move on.

Then walk the ROI figures from the calculator:

- Cover the ROI figures on the calculator (right-hand side)
- Add up the savings column until you reach the RRP cost — that's the ROI year
- State it cleanly: “you'd have your full investment back by year [X]”

Tonality: confident certainty. The numbers are doing the work — you're just narrating the math. Skip ahead to the Real Cost of Power contrast beat after this.

Path B: If they say green loan

This is the longer path — take the time to land it properly. Sell the finance company hard. The customer needs to feel the rep has chosen the best possible finance partner for them, not just the easiest one. Same energy as selling the battery hardware — lean into it.

Beat 1 (Path B): Frame why you use a third-party finance company

Open with the explicit framing: we're not a finance company. We chose this one because they're the best. The choice IS the credibility — it makes it feel like a curated recommendation, not a tied-in financial product.

“So just so you know, we're not a finance company — we elect to use [finance partner] because they're the best in the space. You're free to use whoever you want for finance, we just recommend this one because they have the most flexible terms and the lowest rate.”

Tonality: matter-of-fact + advisory. The “we just recommend this one” framing is what makes it land as curated advice rather than a financial pitch.

Beat 2 (Path B): Sell the finance company (dot points)

Walk the strongest features. Same energy as the battery hardware sell — lean into it. The “show them the website” move is critical — visual proof removes any “is this rep just telling me what I want to hear” doubt.

- “No early exit fees — if you ever want to pay off the loan early, no penalty”
- “No early payment penalties — you can pay extra at any point and you're actually rewarded for it (no interest on what you pay early)”
- “Look at this — on their website: ‘repay your loan and close your account at any time without penalty’” (show them the actual website if possible)
- “Lowest green loan rate — [X]% (this is one of the lowest available because it's designed as a stepping-stone product for first loans, but we use it for solar to get you the lowest possible rate)”

Tonality: confident + slight enthusiasm. Same energy as the battery hardware sell — lean into it. The live website demo is the proof point that makes everything else credible.

Localisation note: the points above are based on a strong AU green loan provider (e.g. Parker Lane). Substitute your finance partner's actual benefits — the principle is the same regardless: name them, explain why you chose them, walk the strongest features, show proof on their website.

Beat 3 (Path B): The recycling-money frame

Land the philosophical anchor of the green loan: you're not adding a new expense, you're recycling money you're already spending. Then walk the term flexibility.

“Flexible terms from 10 to 15 years — most people go on a 15-year plan as it manages the finances a little better. The whole point of this is you're literally using the money from the solar to pay the system off. By the way guys, you're simply recycling the money you're already paying on your bills — and you're letting the system pay itself off.”

Tonality: confident + casual. The “recycling money you’re already paying” line is the philosophical anchor — land it with weight. The customer should hear: “wait, this isn’t a new expense, it’s a redirect.”

Beat 4 (Path B): Walk the payment options

Show the monthly / fortnightly / weekly options. Let the customer see the flexibility.

“There’s a monthly and set-up amount there as you can see, but that’s built into the repayments. You have the option of \$[X] per month, \$[X] per fortnight, or \$[X] per week.”

Tonality: matter-of-fact. Show the figures cleanly — don’t pitch the affordability, just present the options.

Beat 5 (Path B): Year 1 comparison

Compare year 1 savings against year 1 repayments — show the small gap. The “\$[X] more per week than what you’re doing now” framing is what converts the abstract gap into something they can mentally compare to their current weekly spend.

“Remember your savings based on this system are \$[X]. The payment for the system is that monthly figure times 12, which is \$[X]. So effectively there’s a small difference in year one of around \$[X] — which is only \$[X] more per week than what you’re doing now for the WHOLE package.”

Tonality: confident + casual. The weekly comparison is critical — land it cleanly.

Beat 6 (Path B): The cash-flow positive moment (fully scripted)

Walk forward to whichever year the deal flips cash-flow positive for THIS customer. The year [X] is calculated from their actual numbers — read it off the calculator.

“Now, as time goes on, by the time we get to year [X], you’re sitting at \$[X] — which means you’re cash-flow positive.”

Tonality: confident + matter-of-fact. The year [X] figure is the inflection point — deliver it as the moment the deal goes from “slightly out of pocket” to “making money.”

“So effectively, in this scenario solar will take around [X] years to hit cash-flow neutral, and beyond that you’re literally leveraging your savings to pay for the system — which obviously is the intelligent thing to do.”

The [X] year figure is calculated from the customer’s specific savings vs. repayments curve. Read it off the calculator.

Beat 7 (Path B): Dead money tieback

Tie back to Pillar 8’s dead money frame. Same money either way — only difference is whether they have panels at the end.

“The worst thing you can do is do nothing, which means you’re just paying money out of your pocket for nothing. In [X] years you’re gonna pay for the cost of a solar system anyway — the only difference is you won’t have any panels on your roof. That’s dead money with no return.”

Tonality: certainty + genuine. Ties back to Pillar 8’s pain anchor. The [X] years figure here is whatever year their cumulative power spend equals the system cost — read it off the calculator.

Beat 8 (Path B): The post-loan ahead position

Frame the long-term payoff. After the loan term ends, the system keeps producing pure savings. The [loan term] figure here = whatever they chose at Beat 3 (typically 10 or 15 years).

“During that time, you’re going to add value to your property, you’re going to protect yourself against increases in the cost of power, and long-term — as you can see — after [loan term] years of a fully-paid-off system, you’re ahead \$[X]. That’s the difference of making this level of investment. Does that make sense?”

Tonality: certainty + genuine. The ahead-position dollar figure depends on their loan term — read it off the calculator at the year their loan ends. Wait for the “yeah” before moving to the 25-year graph beat.

SLIDE 6: REAL COST OF POWER — LAW OF CONTRAST (CASH PATH)

If the customer chose cash (Path A), deliver this contrast beat now — they didn’t get the dead money tieback during the green loan walk-through, so they need it here. If they chose green loan (Path B), skip this slide — Path B Beat 7 already covers the same dead-money frame.

Beat 1: The contrast frame (fully scripted)

Frame the choice as binary: same money, different outcomes. This builds on the Pillar 8 dead-money anchor and weaponises it for Pillar 9.

“Remember guys — you’re either going to give tens of thousands to the electricity company whether you do this or not. In [X] years you’re paying for a solar system anyway — the only difference is you won’t have any panels on your roof.”

“This is all dead money that’s giving you no return — literally the definition of a liability. In 15 years you will either be \$[X] down the drain, or \$[X] better off and you’ll have fully paid off a system, also adding value to your home, becoming energy independent, and doing your part for the environment.”

Tonality: certainty + genuine. The “literally the definition of a liability” line lands hard — said matter-of-fact, not preachy. The 15-year either/or framing is the closing punch of this beat.

SLIDE 7: 25-YEAR GRAPH (GREEN LOAN PATH ONLY)

If the customer is on the green loan path, walk the 25-year graph showing savings vs. repayments. If they’re on the cash path, skip this slide — it’s about the savings encompassing the loan repayments, which doesn’t apply for cash buyers.

Beat 1: Walk the graph (fully scripted)

Reference the visual elements directly — you’re just walking the customer through what’s on screen. Don’t overstate the encompassed framing (we’re only showing solar at this point, not the full picture).

“This graph really puts things into perspective. As you can see, the orange area represents the total solar savings, while the green area shows the solar repayments.”

“That little extra bar above the savings is what I like to call your ‘pocket change’ — your feed-in tariff credit. After [loan term] years, that’s when the real game begins — from that point on, it’s all savings and profit.”

Tonality: confident + matter-of-fact. The “pocket change” framing for the FIT credit is a warm touch — it acknowledges it’s small but it’s yours. The “real game begins” line is the structural anchor — deliver it with weight. [Loan term] = whatever they chose at Beat 3 (typically 10 or 15 years).

Adjust the colour names you say to match what’s actually on the graph. Don’t describe colours that aren’t there — it kills credibility instantly.

SLIDE 8: TIE IT ALL TOGETHER + FINAL CHECK-IN

Recap everything before the Pillar 10 transition. The customer must be fully sold on four things before the case study offer is introduced. If they’re not solid on any of these, the case study reveal lands flat — because the case study is a discount on a system they haven’t fully bought into yet.

Beat 1: The recap

Briefly tie back the financial picture, the warranties, the system design, and the brand. Don’t re-walk each in detail — just remind them everything has been covered.

- Recap the financials — rebates, year 1 savings, 10/15/25-year cumulative, FIT credits
- Reinforce the brand — warranties, peace of mind, system quality, ongoing support
- Anchor the design — “this system was built specifically for your home”
- Close on the pricing — “that’s the investment, and that’s what it returns”

Tonality: confident + casual. This is a quick tie-it-all-together — not a re-pitch. The customer should feel the picture come into focus.

Beat 2: The hard rule before Pillar 10

BEFORE MOVING TO PILLAR 10, THE CUSTOMER MUST BE SOLD ON ALL FOUR: BRAND/WARRANTIES, SAVINGS/NUMBERS, SYSTEM DESIGN, PRICING.

If any one of these is shaky, the case study offer in Pillar 10 lands flat — because the case study is a discount on a system they haven’t fully bought into yet. A discount on a “maybe” doesn’t move anyone. A discount on a “we’re ready, just figuring out how” closes deals.

Beat 3: The final check-in (fully scripted)

Real check-in. Both partners. Wait for confirmation from each.

“Just before I go any further — does this all make sense? Do either of you have any questions at all?”

Tonality: genuine + casual. Wait for confirmation from BOTH partners. If only one engages, address the silent partner directly: “[Name] — anything you want to ask before we move on?”

If they raise a question, address it fully before moving to Pillar 10. Don't rush past unresolved concerns — they become objections at the close.

Beat 4: The battery transition (fully scripted)

Once both partners are clear and bought in, ask the battery transition question. Their “yes” is the verbal commitment that pulls them into Pillar 10.

“Alright guys — you can see you’d be out of pocket a little bit, which obviously that’s not our goal. We want to make it so it costs you nothing. Do you want to jump into the battery side of things and see how it changes everything?”

Tonality: genuine + curious. Asked like you’re wondering what they want to do, not steering them. The customer almost always says “yeah, we’re good to go” or similar — respond with a calm “yeah, perfect” and move on. Don’t over-celebrate the yes.

The “that’s not our goal — we want to make it so it costs you nothing” line is the alliance signal. It tells the customer: “we’re not trying to sell you a system that leaves you out of pocket — we’re trying to make it work for you.” This is what makes the Pillar 10 case study reveal feel earned rather than manipulative.

Beat 5: Critical screen behaviour

WHEN THEY SAY YES — LEAVE THE SOLAR-ONLY SAVINGS BREAKDOWN ON SCREEN. DO NOT NAVIGATE AWAY.

The visual reference point of the solar-only numbers is what makes the battery reveal in Pillar 10 land. The customer should be able to see the “before” state while you walk them through the “after.”

If the rep flips to a new tab or scrolls to a different page when transitioning to Pillar 10, the customer loses the visual anchor for the comparison. Keep the solar-only breakdown visible, then walk through the battery on top of it. The contrast is what sells.

FAILURE MODES (DO NOT DO)

- **Skipping the specificity build (Slide 1).** If you silently set up the calculator off-camera and then reveal pre-baked numbers, you waste the strongest credibility moment in the pillar. The customer needs to SEE you plug their specific data in — that’s what makes the Savings Guarantee feel earned.
- **Failing to cash in the Pillar 6 production chart promise.** If you don’t reference the chart from earlier, the production reveal lands as just another data point. The structural payoff — “we promised you’d see this and now here it is” — is what makes it powerful.
- **Pitching pricing instead of presenting it.** The moment you soften, hype, or apologise for price, the customer reads it as a sales move. Walk the breakdown flatly. If they react, address it — but don’t pre-empt a reaction that may not come.
- **Skipping the solar-only pre-frame at the start of Slide 1.** Without setting the “solar first, then battery” frame before any numbers come out, the customer reacts to the modest solar-only savings as the final answer. The Pillar 10 reveal then lands as “wait, you didn’t tell me there was more” instead of as the planned next step.

- **Skipping the Slide 4 pre-frame (“this is the most important part”).** Without flagging the savings walk as the moment that matters, the customer doesn’t engage at the depth required. They nod through the numbers and stall at the close because comprehension was shallow.
- **Skipping the year 1 month/week breakdown.** The annual figure is abstract — the weekly figure is something they can feel. Without breaking it down, the savings reveal lands as a number, not as a tangible reality.
- **Overselling solar-only savings.** Hype on the modest numbers tells the customer “this is the result” — which kills the Pillar 10 contrast. Frame it honestly as “saving more than spending, but still out of pocket a little bit.” The honesty IS the setup.
- **Going above 50/50 on day/night usage.** The 50/50 cap is a HARD ceiling. If a customer claims 60% or 70% daytime usage, you weight it down to 50/50 max. Going higher inflates self-use, violates the Savings Guarantee promise of conservative numbers, and reduces the battery’s structural impact in Pillar 10. Define “day” as 9am–3pm only — that’s the honest framing.
- **Skipping the cash vs. green loan question.** Without bifurcating the path, you either over-pitch finance to a cash buyer or skip the green loan walkthrough for someone who needed it. Both kill the deal at different points.
- **Skipping the 4-point check before Pillar 10.** Brand/warranties, savings/numbers, system design, pricing — all four must be solid before the case study offer is introduced. A discount on a system they haven’t fully bought into is a discount on a maybe.
- **Statement-based transition instead of question-based.** Telling the customer “let’s jump into the battery” is weaker than asking “do you want to jump into the battery?” The question creates a verbal yes that pulls them into Pillar 10 as participants, not passengers.
- **Navigating away from the solar-only breakdown when transitioning to Pillar 10.** The visual anchor of the solar-only numbers staying on screen is what makes the battery reveal land as a comparison. If the rep flips away, the “after” reveal feels like a fresh calculation instead of an upgrade.

TRANSITION INTO PILLAR 10 (CASE STUDY CLOSE)

Pillar 9 hands off to Pillar 10 the moment the customer says “yes” to the battery transition question — with the solar-only breakdown still visible on screen. No additional scripted line needed. The customer’s yes is the unlock.

Pillar 10 then opens by adding the battery to the calculation — sized off the night-usage % (the gap between self-use and total daily usage), capped at 85% for the Savings Guarantee buffer, walked through the full battery savings reveal, then the case study offer is introduced as the moment that flips the deal cash-flow positive.

The structural arc of Pillars 9–10: solar-only modest (still out of pocket) → battery added (covers the gap) → case study discount (flips it cash-flow positive). Each step is a discrete reveal that compounds the previous one. The screen stays anchored on the original solar-only breakdown the entire time, providing constant visual reference.

Remember: this pillar is the structural setup for the case study reveal. Solar-only modest, battery held back. Don't oversell. Don't skip the 4-point check. The contrast does the selling.
